

Do you want to visit a Living Lab Infrastructure to conduct your research studies?

VITALISE covers your travel & accommodation expenses to visit and conduct research studies in Living Lab infrastructures in other countries for free.

1

Introduction

Research Infrastructures act as fundamental building blocks of research and innovation, in relation to addressing imperative global societal challenges, such as health related issues and the ageing population. In this direction, **Living Labs** have emerged as resilient Research & Innovation infrastructures that have proved to be key to the integration of **Research & Innovation processes in real life settings**, focusing primarily on **people** and their engagement in research procedures. ● ● ●

2

Transnational Access

Adhering to the principles of open science and innovation, VITALISE project provides wider, simplified, and more efficient access to seventeen (17) Living Lab Research Infrastructures to researchers from multiple disciplines to conduct research studies, allowing for free mobility of researchers and flow of knowledge and technology on an international level. To this end, the project has partnered with nine (9) Living Labs from **Greece, Belgium, Spain, Austria, Hungary, Finland** and **Canada** who are accepting research proposal submissions until 30 April 2022 (results announced by 31 July 2022). ● ● ●

3

Modality of Access

Transnational Access can be either (i) fully in-person, (ii) partially remote (i.e., in-person access for a specific time period combined with remote access to the infrastructure's facilities for the rest of the unit of access) or (iii) fully remote. Transnational Access **expenses are completely covered** by the project and during in-person access researchers will receive financial support for **travel subsistence** and **daily allowance**. Researchers may only apply for Transnational Access to the Living Lab Infrastructures situated in different countries from their own. ● ● ●

4

Joint Research Activities

Researchers are encouraged to submit research proposals concerning the project's three Joint Research Activities (JRAs) on (i) **rehabilitation**, (ii) **transitional care** and (iii) **everyday living environments**, and collaborate with the project partners to conduct research studies in one of these areas. However, researchers from multiple disciplines are eligible to join (e.g., policy makers, experts in communication studies, social workers, computer/technology scientists, psychologists, experts in sport science, pedagogues/educators, data scientists, etc.) and propose their own research studies. ● ● ●
